

Lab 8

Unable to include screenshots, only have one computer

Q1

The TCP Client creates a socket, which then connects to the TCP server to send and receive data.

The TCP ~~client~~ Server creates a socket and binds it, then it listens to all client sockets bound to it, accepts their data and sends and receives data between the client sockets.

Q2

TCP is a connection protocol and UDP is a connection-less protocol. TCP establishes a connection between the sender and receiver before data can be sent, UDP does not establish a connection before sending data.
